Abstract. The Large sky Area Multi-Object Fiber Spectroscopic Telescope (LAMOST) is the largest optical telescope in China. In last four years, the LAMOST telescope has published four editions data (pilot data release, data release 1, data release 2 and data release 3). To archive and release these data (raw data, catalog, spectrum etc), we have set up a data cycle management system, including the transfer of data, archiving, backup. And through the evolution of four software versions, mature established data release system.

1. Introduction

The Large sky Area Multi-Object Fiber Spectroscopic Telescope (LAMOST) is the largest optical telescope in China(Cui et al. 2012). The size of its main mirror is 6.67 meters with 4 meters effective aperture. LAMOST is characterized by both a large field of view and large aperture.

After first light in 2008, the pilot sky survey from 2010 to 2012, and the regular sky survey is in progressing from 2012 to 2017. In the last four years, the LAMOST telescope has operated about 900 night. The raw data volume is about 18TB, and the product data contains about 4 million spectra, 5TB FITS files.

2. Architecture

The data cycle management system architecture shows in Figure 1.

3. Application

3.1. Data Flow

The data flow is shown in Figure 1:

- The site transfer raw data to China-VO Data Center. (He et al. 2015)
- Data Center push raw data to Pipeline Server.
- Pipeline generate product data (catalog and spectra FITS files) and return to Data Center.

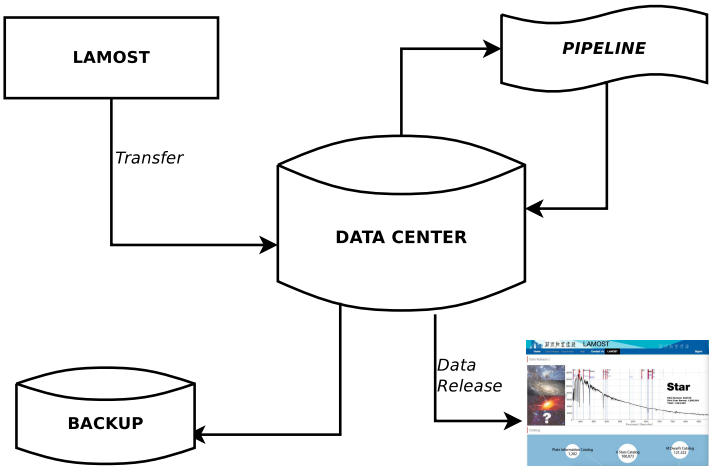

Figure 1. The data cycle management system architecture

- Backup raw data and product data to Backup Storage(in the third place).
- Push product data push to Data Release Server. (Fan et al. 2015)

3.2. Data Statistic

In the Last few years, the telescope runs about 250 days per year. Till now, LAMOST has about 900 observation nights. As show in Figure 2, in these 900 night, the average size of raw data is about 20GB per night.

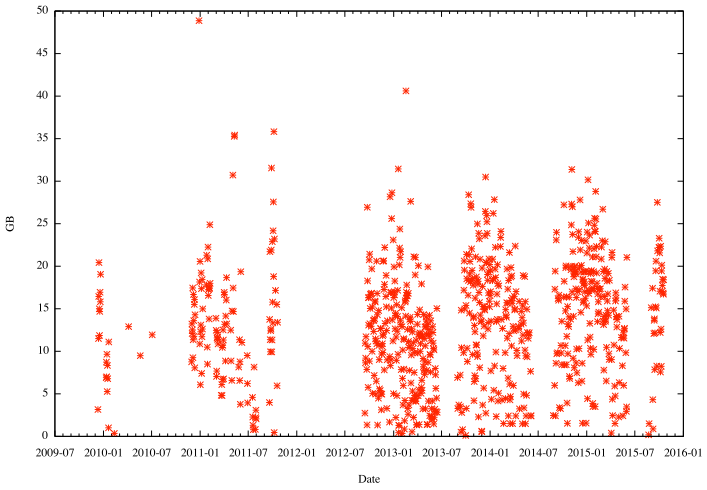

Figure 2. Raw data statistic.

3.3. Data Release

After the LAMOST pipeline, the product data (catalog and spectra) will be released to users:

□ In 2012, before the IAU General Assembly in Beijing, LAMOST Release the Pilot Data Release (PDR)(Luo et al. 2012)

□ In 2013, LAMOST release the first Data Release (DR1)[1], and in 2015 spring, all the DR1 data release to public.(Luo et al. 2015). As shown in Figure 3.

□ In 2014, LAMOST release the second Data Release (DR2)[2]. As shown in the left part of Figure 4.

□ In 2015, LAMOST release the third Data Release (DR3)[3]. As shown in the right part of Figure 4.

The data release software requires:

- Java Web Framework: Spring Framework[4].
- Database: PostgreSQL[5], pgSphere [6].
- Web Server: Nginx[7].
- User Management: CSTNET Passport[8].
- Code Management: China-VO Code Repository Management[9], based on GitLab[10],

4. Conclusion

LAMOST is an effective spectra telescope, so the data management is very challenging. Over the practical experience in past few years, we have set up a series of software and tools. In the future, We will upgrade these software and tools continually.

Acknowledgments. The Guo Shou Jing Telescope (the Large Sky Area Multi-Object Fiber Spectroscopic Telescope, LAMOST) is a National Major Scientific Project built by the Chinese Academy of Sciences. Funding for the project has been provided by the National Development and Reform Commission. Data resources are supported by Chinese Astronomical Data Center(CAsDC, http://casdc.china-vo.org).
